Reconstruction Algorithms

WA89: maximum likelihood method

- Given ring center & momentum \rightarrow predict rings radii for mass hypotheses π , K and p
- Assume gaussian distribution of the measured radii, the signal is

$$S_j(\vec{x}^{(i)}) = \frac{n_j}{2\pi R_j} \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(r^{(i)} - R_j)^2}{2\sigma^2}}$$

- Probability to observe exactly m PMT's

$$P(m \text{ PMT's}) = \frac{e^{-p_j} p_j^m}{m!}$$

where $p_j = s_j + b$. s_j and b are the expected number of signal and background PMT's respectively.

Reconstruction Algorithms

- Likelihood function for hypothesis j (π , K and p)

$$L_j = P(m) \times \prod_{i=1}^m \frac{S_j(\vec{x}^{(i)}) + B(\vec{x}^{(i)})}{s_j + b}$$

$$L_j = \frac{e^{-b}}{m!} e^{-s_j} \prod_{i=1}^m \left(\frac{n_j}{2\pi R_j} \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(r^{(i)} - R_j)^2}{2\sigma^2}} + B(\vec{x}^{(i)}) \right)$$

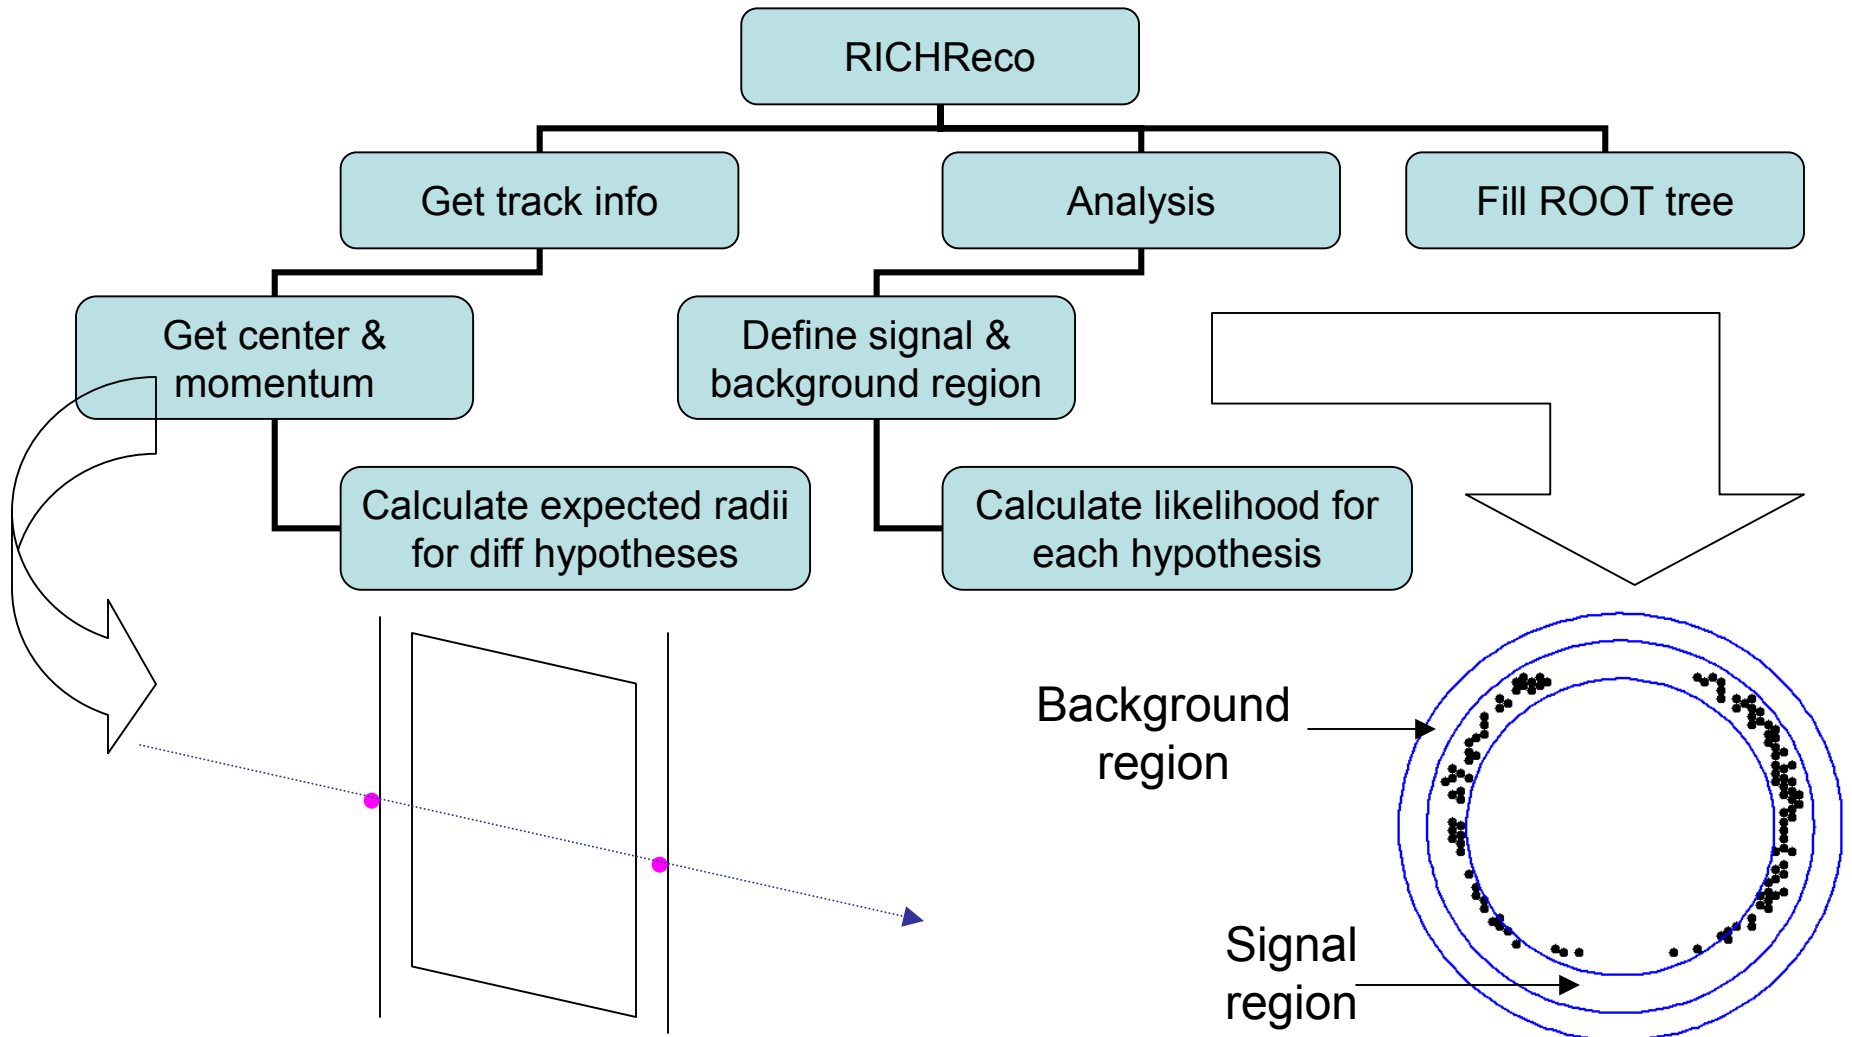

- Likelihood ratio

$$R_{ij} = \frac{L_i}{L_j}$$

3 different likelihood ratios:

$$R_{\pi K} = \frac{L_{\pi}}{L_K}, \quad R_{\pi p} = \frac{L_{\pi}}{L_p}, \quad R_{Kp} = \frac{L_K}{L_p}$$

Reconstruction Code Flow Chart

Reconstruction Code

- Current Code

- Get track info

- MC true momentum of a track is used and will be replaced once track reconstruction is in place
 - Only tracks that pass through both upstream & downstream DCs are considered
 - Constant index of refraction is used to calculate expected ring radii for different particle hypotheses

- Analysis

- Signal region: $(R_{smallest}-3cm)$ to $(R_{largest}+3cm)$
 - Background region: $(R_{smallest}+3cm)$ to $(R_{largest}+8cm)$
 - Assume space resolution $\sigma = 0.55cm$
 - Assume $n_e=100$ (94 digits for proton ring @ 40GeV) and $n_j=n_e(R_j/R_e)^2 \rightarrow$ PMT efficiency is not taken into account

Event Display

Single Event Display (Event 622)

$\text{Log}(R_{\pi K})$ Raw Distribution for Different Momentum Ranges

$p \leq 40 \text{ GeV}$

$\text{Log}(R_{\pi K})$ distribution for $p \leq 40 \text{ GeV}$

$40 \text{ GeV} < p \leq 80 \text{ GeV}$

$\text{Log}(R_{\pi K})$ distribution for $40 \text{ GeV} < p \leq 80 \text{ GeV}$

$p > 80 \text{ GeV}$

$\text{Log}(R_{\pi K})$ distribution for $p > 80 \text{ GeV}$

Likelihood ratio cut value changes as a function of momentum
Probably due to constant expected PMT's assumption

$\text{Log}(R_{\pi p})$ Raw Distribution for Different Momentum Ranges

Tracks below threshold momentum or with too few digits

$p \leq 40 \text{ GeV}$

$40 \text{ GeV} < p \leq 80 \text{ GeV}$

$p > 80 \text{ GeV}$

$\text{Log}(R_{\pi p})$ distribution for $p \leq 40 \text{ GeV}$

$\text{Log}(R_{\pi p})$ distribution for $40 \text{ GeV} < p \leq 80 \text{ GeV}$

$\text{Log}(R_{\pi p})$ distribution for $p > 80 \text{ GeV}$

Likelihood ratio cut value changes as a function of momentum
Probably due to constant expected PMT's assumption

$\text{Log}(R_{Kp})$ Raw Distribution for Different Momentum Ranges

Tracks below threshold momentum or with too few digits

$p \leq 40 \text{ GeV}$

$40 \text{ GeV} < p \leq 80 \text{ GeV}$

$p > 80 \text{ GeV}$

$\text{Log}(R_{Kp})$ distribution for $p \leq 40 \text{ GeV}$

$\text{Log}(R_{Kp})$ distribution for $40 \text{ GeV} < p \leq 80 \text{ GeV}$

$\text{Log}(R_{Kp})$ distribution for $p > 80 \text{ GeV}$

Likelihood ratio cut value changes as a function of momentum
Probably due to constant expected PMT's assumption

Likelihood Ratio Cut

$\text{Log}(R_{\pi K})$ vs. Momentum

$\text{Log}(R_{\pi K})$ as a function of momentum

Likelihood Ratio Cut

$\text{Log}(R_{\pi p})$ vs. Momentum

$\text{Log}(R_{\pi p})$ as a function of momentum

Likelihood Ratio Cut

$\text{Log}(R_{Kp})$ vs. Momentum

$\text{Log}(R_{Kp})$ as a function of momentum

Efficiency for Identifying π

Efficiency for identifying π (w/o cut)

Efficiency for identifying π (w/ cut)

$$Efficiency = \frac{\# \pi \text{ identified}}{\# \pi \text{ from MC}}$$

Efficiency for Identifying K

Efficiency for identifying K (w/o cut)

Efficiency for identifying K (w/ cut)

$$Efficiency = \frac{\# K \text{ identified}}{\# K \text{ from MC}}$$

Efficiency for Identifying p

Efficiency for identifying p (w/o cut)

Efficiency for identifying p (w/ cut)

$$Efficiency = \frac{\# p \text{ identified}}{\# p \text{ from MC}}$$

RICH Data Stream

RICHRing Class

- PMT's
- Ring center
- Momentum
- Reconstructed particle ID
- Expected radii of all hypotheses (e, π , K, p)
- Likelihood of all hypotheses (e, π , K, p)

TOF Study

TOF Study: Efficiency for Identifying p

5cm-TOF

1cm-TOF

Next Step

- RICH reconstruction: almost complete
 - Vary signal & background regions to optimize ring reconstruction
 - Calculate expected number of PMT's
- Get momentum & direction for each track from previous reconstruction stage
